CMC dossier - APAC

Safety update - EU

Label package - LATAM

1. Why the original design needs a stronger story

The original document has solid UX work, but it reads like project documentation. For hiring, it needs clearer business context, user pain, product strategy, polished UI concept, and measurable value.

Business trigger

Company A acquired Company B and needed a unified tool for regulatory document transfer.

Workflow issue

Teams were manually zipping folders, handling large files, and tracking status through fragmented communication.

Regulatory complexity

Packages vary by region: Europe, Central America, Latin America, and APAC.

UX opportunity

Transform a basic upload workflow into a guided regulatory transfer hub with dashboard visibility.

2. Competitor patterns to borrow

Modern RIM and submission platforms do more than upload files. They sell trust: structure, workflow visibility, validation, audit readiness, and a single source of truth.

Veeva RIM

Unified regulatory platform

Takeaway

One workspace, not a file uploader

Ennov RIM

Registrations, submissions and dashboards

Takeaway

Connect status with region and owner

ArisGlobal LifeSphere

Planning, tracking and collaboration

Takeaway

Make progress visible across teams

IQVIA SmartSolve RIM

Global compliance and document management

Takeaway

Show compliance confidence

Freyr SUBMIT PRO

eCTD validation and publishing workflow

Takeaway

Add validation before transfer

3. Refreshed information architecture

The new webpage should explain the product as an enterprise-grade regulatory workflow, then show how the user moves from package creation to monitoring and audit readiness.

1

Overview

Region defaults, package volume, urgent actions

2

Create Package

Guided metadata, folder browse, auto naming

3

Validate

Extension rules, size checks, missing fields

4

Route

Regulatory committee and region standard

5

Monitor

Upload progress, status, owner, date filters

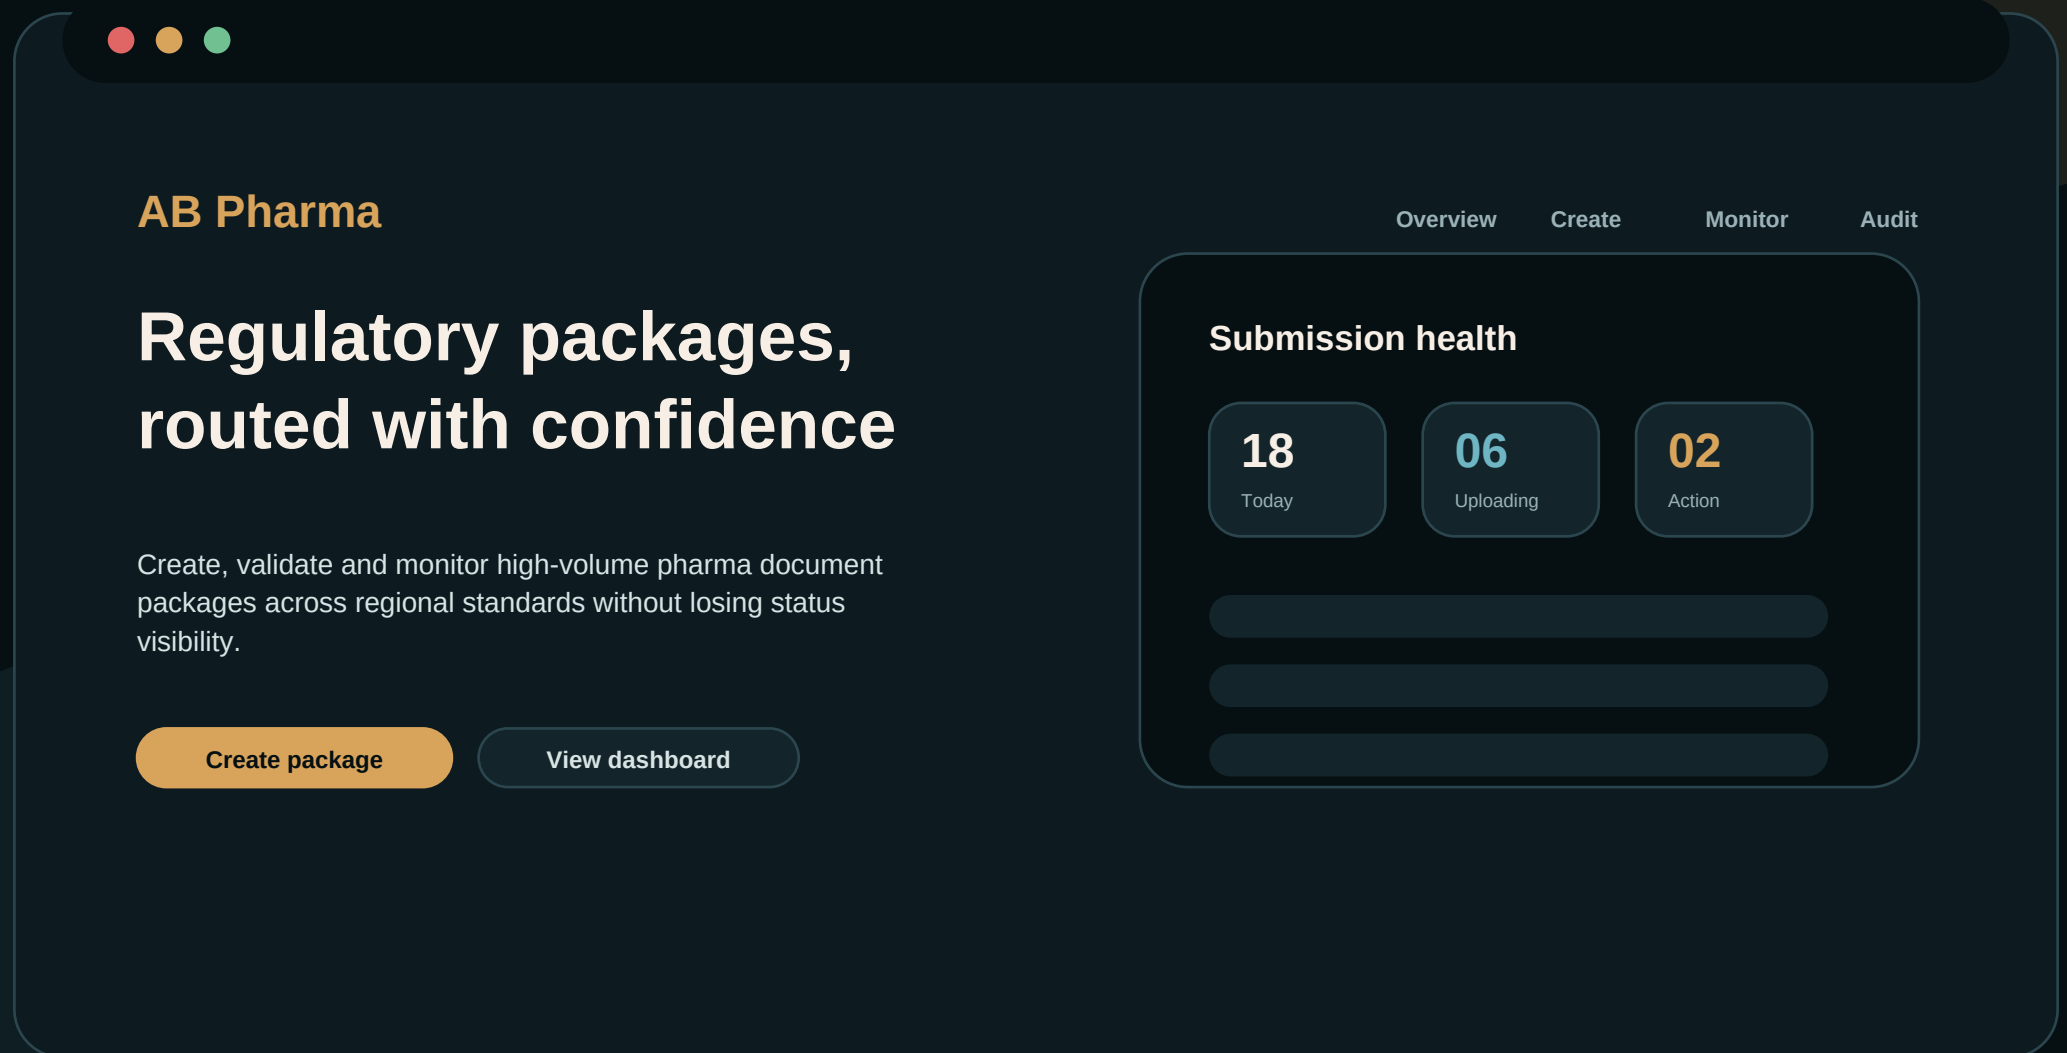

6

Audit

History, install notes, user manual, release evidence

4. Redesigned webpage concept

A job-ready case study should include a polished hero and product narrative. This mockup frames AB Pharma as a secure regulatory transfer hub.

5. Dashboard and upload flow design

A cleaner upload experience should guide the user step by step: choose region, enter package details, validate rules, then monitor transfer status.

Create regulatory package

Guided form with region-aware fields and auto-generated paths.

Region

APAC

Product area

Oncology

Package type

Safety update

Target committee

APAC regulatory

Folder path

Auto populated from selected region and metadata

Validation and status

Show what is ready before transfer begins.

Extension rule

Passed

Size limit

Below 80 GB

Naming

Complete

Region route

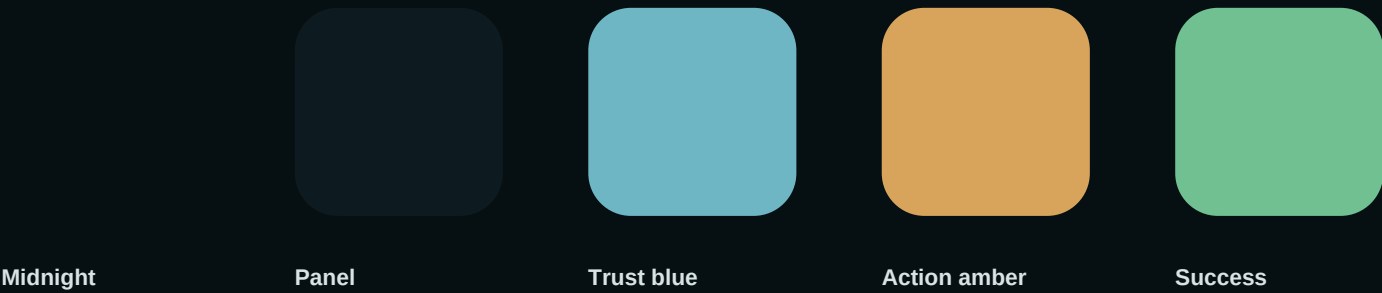

Ready

Transfer progress

6. Visual system for a stronger portfolio impression

The visual system should look enterprise-ready: dark secure background, clinical blue-grey panels, warm action color, strong typography, and clear status chips.

Component ideas

Region chip

Default region reduces repeated selection.

Validation panel

Prevents submission mistakes before upload.

Progress timeline

Shows package stage and team ownership.

Audit row

Keeps release and handover evidence visible.

7. How this should help your job search

This redesign changes the story from a basic internal UI into a mature enterprise UX case study. It shows research, systems thinking, regulated workflow understanding, and a clear visual upgrade.

1

Lead with business impact

Explain the acquisition context and why the old tool failed.

2

Show complexity

Mention 1-80 GB packages, multiple regions and varying regulatory standards.

3

Show your UX decision making

Connect interview findings to dashboard, filters, validation and region defaults.

4

Show delivery credibility

Include prototype, front-end development, Spring Boot integration, UAT and release support.

5

Use the refreshed visual direction

Present polished screens first, then include the original documentation as proof of process.
